Objetivo docente

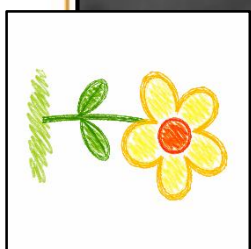

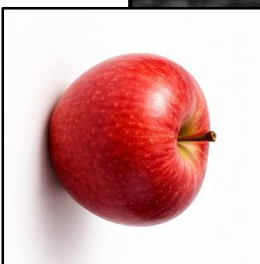

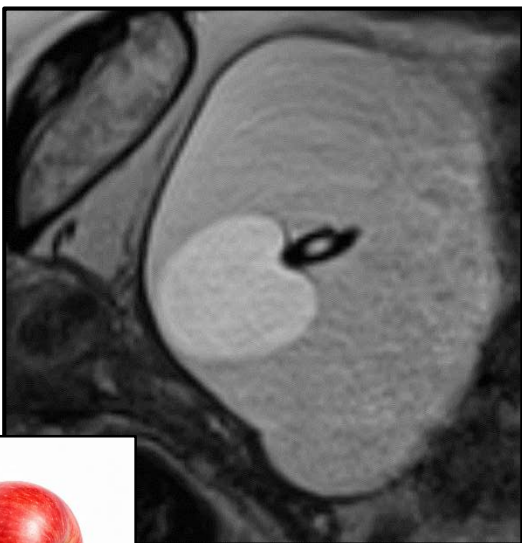

- Ofrecer a los lectores un rato de desconexión: una mirada a las imágenes médicas con otra lente, la de la imaginación
- Desenfocar un poco la mirada, dejarse llevar y, sobre todo, disfrutar de la radiología desde un ángulo inesperado

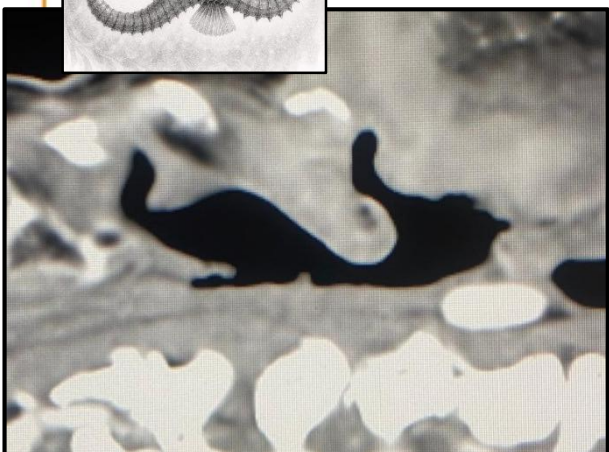

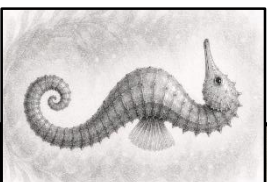

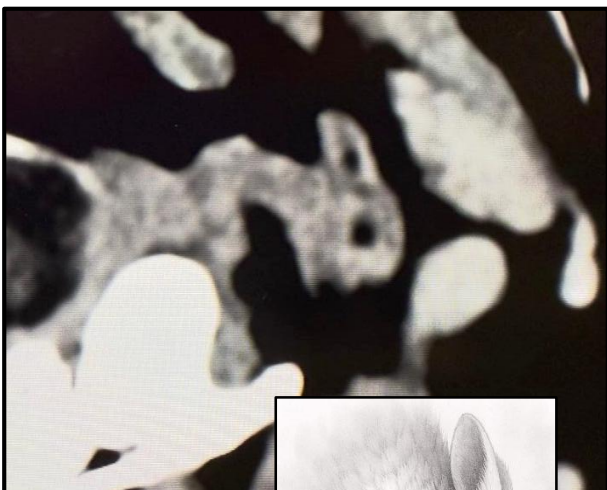

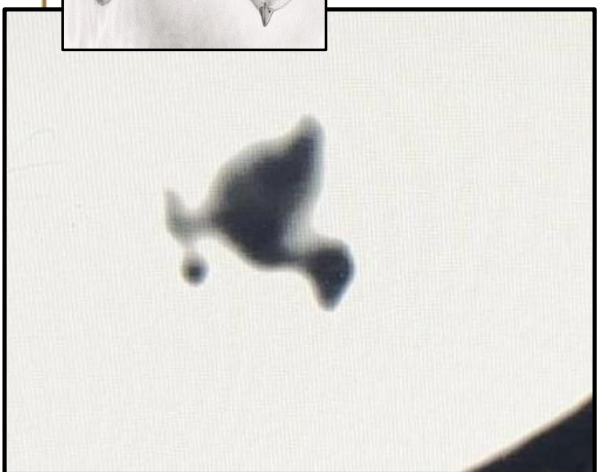

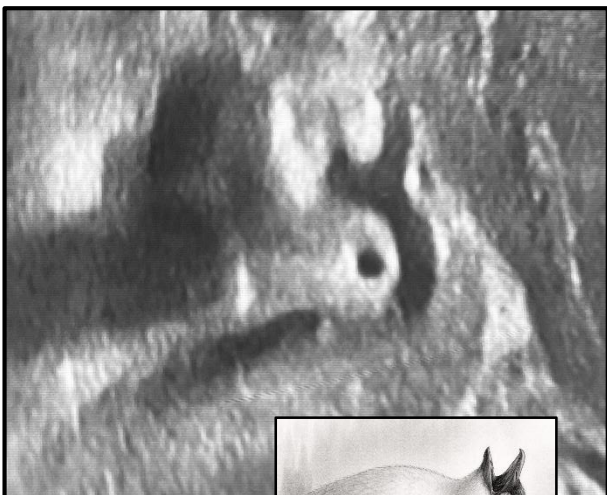

¿Nunca le ha parecido que una TC le devolvía la mirada, o que una RM escondía un personaje extraño? No son desvaríos: son **pareidolias**, ilusiones de percepción que nos hacen reconocer formas conocidas en estructuras que nada tienen que ver, como por ejemplo una cara en un enchufe.

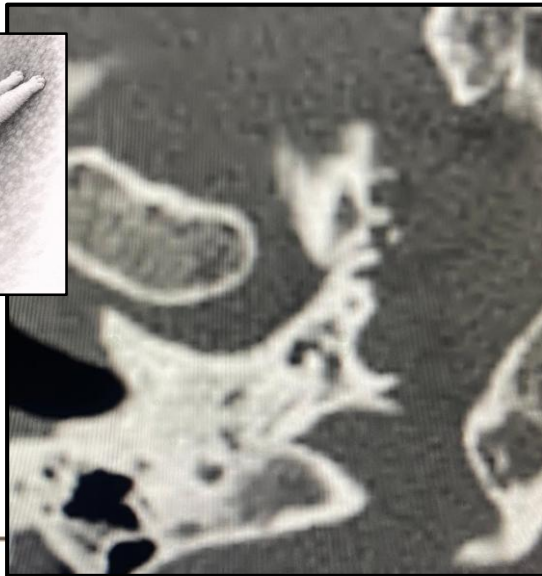

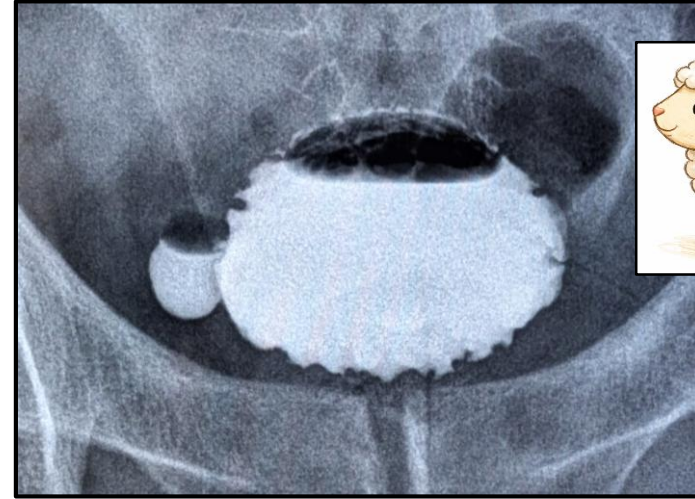

- Este fenómeno tiene raíces bien descritas: nuestro cerebro, y en particular el giro fusiforme, está especialmente entrenado para detectar caras, incluso cuando no existen. Un “defecto evolutivo útil” que nos mantiene alerta y, de vez en cuando, nos arranca una sonrisa.
 - Queremos compartir una selección de “**ilusiones radiológicas**” que hemos recopilando en los dos últimos años, junto con las asociaciones que hicimos.

Miscelánea

¡Y por supuesto, caras!

Conclusiones

Esperamos animar a todos a disfrutar de la radiología con humor y curiosidad, demostrando que también hay espacio para la creatividad en medio de la rutina diaria.
